Education

FAST National University of Computer and Emerging Sciences

BS Computer Science

CGPA: 3.07/4.0

Islamabad, Pakistan

Expected July 2025

Experience

AI Engineer

MTBC CareCloud — April (2025) – March (2026)

- Built Agentic AI systems to automate workflows and improve efficiency.
- Developed chatbots improving engagement and reducing response time.
- Designed RAG-based systems for knowledge retrieval.

Research Assistant

FAST University

- Performed preprocessing, feature engineering, and model optimization.
- Improved model performance through experimentation.

Projects

AdInsight

Python, JS, TensorFlow, PostgreSQL

- Developed a browser extension platform for video ad analysis with modules for engagement tracking, demographic analysis, and object detection.

Agentic Online Exam Monitoring System

Python, LangGraph, LangChain, OpenCV, deepface, mediapipe

- Designed an end-to-end **AI proctoring system** starting with automated **face-based attendance verification**.
- Built multi-agent pipelines for real-time monitoring including **gaze tracking, head pose, body movement, multi-face detection, mobile usage, tab switching, and voice activity**.
- Orchestrated parallel agents using **LangGraph** and aggregated signals for intelligent decision-making.
- Generated structured **exam integrity reports** using LLM-based reasoning from multi-modal inputs.

AI-Powered Recruitment System (IARS)

LangChain, LangGraph, FastAPI, React

- Built an end-to-end **Agentic AI hiring pipeline** automating job description generation, CV parsing, and candidate shortlisting.
- Designed multi-agent workflows using **LangGraph** for JD generation, resume parsing, scoring, and communication.
- Implemented **semantic candidate matching** using embeddings and multi-factor scoring (skills, experience, projects, GitHub).
- Developed automated email system for interview invitations and follow-ups using LLM-generated responses.

Virtual AI Doctor

Langchain, Langgraph, Openai api, Flask, Fast api

- Developed a virtual AI doctor that interacts with patients to understand their symptoms and provide basic medical advice and over the counter treatments. The agent uses symptom analysis to detect serious conditions and ensures patient safety through timely escalation. If critical symptoms are detected, it automatically refers the case to a human doctor and books an appointment. This project demonstrates the use of Agentic AI for accessible, automated, and responsive healthcare support.

Technical Skills

Languages: C++, Python, Dart, Go, JavaScript, Java

Tools: Git, Docker, Linux, MongoDB, PostgreSQL

AI/ML: TensorFlow, PyTorch, Scikit-Learn, OpenCV, Pandas, NumPy

Frameworks: LangChain, LangGraph, Flask, FastAPI
